

[illegible]

Pamphrey College

1. Beginning of interest

- rev memory ~~of~~ with technology with help of family
- me "experimenting" looking on internet, building, travelling
- Don't say I wanted to be an EE
- I was naturally drawn to science, coding, & games

2. The interest grows during 2-4 years

- I wanted to understand the why & how
- Research especially in bio-magnetics. It fascinated me
- At a kid I wanted to build smart glasses & drew sketches & created documents of how; I first experimented with smoke ~~screen~~ & shining a projector to get an understanding
- 7th grade I skipped a math & was ~~not~~ really interested in math. I found it appealing in science & in technology in so many ways. I remember doing these small little projects with friends that meant the world to us

3. My process of learning

- I learned about lev-magnet from a friend. I further researched & ~~learned~~^{discovered} ideas based on ~~as a result for~~ ^{space} bending.
- I questioned about other implications & learned about magnet brains & wanted to experiment on my own & how to control. I studied on electromagnet so I can control how strong it has to create magnets
